

ABSTRACT (OPTIONAL) AND FINAL NOTES (NON-LIMITING)

A. Abstract (Optional)

Disclosed are systems and methods for privacy-preserving measurement and interpretation of intimate physiology using a plurality of sensing nodes and a computing system. The sensing nodes may include one or more external wearable nodes configured for longitudinal measurement, one or more intraluminal nodes configured for longitudinal tissue-adjacent measurement, one or more session-based geometry measurement nodes configured to acquire repeatable geometry baselines, one or more intraluminal geometry/compliance nodes configured to acquire internal geometry and compliance metrics using endpoint sensing and controlled radial stimulus, and one or more upper-body context nodes configured to provide physiologic context. The computing system receives node data, performs signal conditioning and artifact rejection, derives privacy-preserving metrics, and performs cross-device correlation and cross-user correlation under consent gating. Outputs are presented as abstract indices, zones, ranges, curves, and confidence indicators without explicit anatomical imagery and without explicit anatomical labeling.

B. Incorporation and Interpretive Notes (Non-Limiting)

Any feature, step, structure, or sensor modality described in any section of this specification may be combined with any other feature, step, structure, or sensor modality described herein. The disclosure contemplates substitutions, modifications, and equivalents. The description and example statements are illustrative only and do not limit the scope of the embodiments.

C. Completion Statement (Non-Limiting)

This specification is intended to support provisional patent filing disclosure requirements by describing representative implementations, variations, and combinations. Additional embodiments may be included through later-added pages, figures, and appendices.
