

NON-LIMITING EMBODIMENTS AND SCOPE PRESERVATION STATEMENT

Illustrative Nature of Disclosed Embodiments

The embodiments described throughout this disclosure are intended to be illustrative examples provided for purposes of explanation and enablement. Specific configurations, sensor combinations, materials, dimensions, operational modes, computational methods, and structural arrangements described herein shall not be interpreted as limiting the scope of the invention unless explicitly stated otherwise.

Numerous variations, substitutions, and modifications may be made without departing from the underlying inventive concepts disclosed. The invention encompasses implementations that perform substantially similar functions using alternative structures, technologies, algorithms, or design approaches whether presently known or developed in the future.

Equivalent Technologies

Any reference to particular sensor types, communication methods, energy systems, processing architectures, or wearable configurations shall include equivalent technologies capable of achieving comparable functional outcomes. Functional equivalence rather than specific component identity defines inclusion within the scope of this disclosure.

Accordingly, replacement of one sensing modality, structural element, or computational technique with another capable of providing substantially similar physiologic monitoring capability shall be considered within the scope of the invention.

Future Technological Developments

The disclosure expressly contemplates incorporation of technologies not yet available at the time of filing, including advances in sensing miniaturization, artificial intelligence, bio-integrated electronics, materials science, energy systems, communication protocols, and human-interface technologies. Future developments achieving longitudinal physiologic monitoring functionality are intended to fall within the inventive scope.

Combination and Subcombination Coverage

Individual features described herein may be implemented independently or in combination with any other disclosed feature. Subcombinations of elements, partial implementations, or simplified embodiments remain within the scope of the invention even where certain features described in other embodiments are omitted.

No Requirement of Specific Order or Arrangement

Operational steps, sensing processes, or computational procedures described herein do not require execution in any particular order unless expressly indicated. Structural arrangements and system architectures may vary while preserving functional intent.

The foregoing statements are intended to preserve broad interpretive scope such that the invention encompasses all implementations reasonably falling within the spirit and conceptual framework of longitudinal wearable physiologic monitoring systems.
